## FOR THE YEAR 1927

---

Herewith is presented the Fifty-eighth Annual Report of Vital Statistics for the Province of Ontario.

### POPULATION

The estimated population for the Province for the year is 3,187,000 which was distributed as follows:

City municipalities.....	1,336,422 or 41.91 per cent.
Towns (over 5,000 population).....	155,061 or 4.86 per cent.
Rural (including towns under 5,000 population).....	1,695,517 or 53.23 per cent.

### BIRTHS, MARRIAGES, DEATHS

Rate per 1,000 of population

#### NATURAL INCREASE

Excess of birth-rate over death-rate

BIRTHS

	1927		1926	
	Number	Ratio	Number	Ratio
Entire Province.....	67,671	21.2	67,617	21.5
Cities.....	30,393	22.7	29,633	22.7
Towns.....	4,041	26.0	3,980	19.0
Rural.....	33,237	19.6	34,004	20.8

The number of births registered during the year was practically the same as in the preceding year—only 54 increase. The rate is 0.3 lower owing to the larger population. It is the lowest birth-rate since 1903 when the rate was 21.1. The highest rate ever experienced was that of 1921. The number of births and rates for a decade appear as follows:

Year	Births	Ratio	Year	Births	Ratio
1918.....	64,729	23.0	1923.....	70,056	23.1
1919.....	62,774	22.0	1924.....	71,510	23.3
1920.....	72,511	25.1	1925.....	70,122	22.6
1921.....	74,152	25.3	1926.....	67,617	21.5
1922.....	71,320	23.9	1927.....	67,671	21.2

The number of births by counties may be found in Table 1. Of the fifty-five counties thirty-three had a rate below that of the Province of 21.2 and in twenty-two the rate was above. All municipalities are included in this. No group of counties in any particular part of the Province indicates locally a higher or lower rate; the deviations from the Provincial rate are scattered. In Table 2 will be found the number of births and birth-rates in the cities, and in Table 3 those of towns of over 5,000 population. The following table is interesting in that it compares the birth-rate where the mothers were residents of the place in which the birth occurred with the rate of total births. The difference between would indicate, so to speak, the non-resident birth-rate.

## ILLEGITIMATE BIRTHS

The illegitimate birth-rate per 1,000 births has fluctuated considerably. In the last 28 years the lowest rate was in 1905 and from that it has risen gradually to its present peak of 28.0. The following shows the rates for 27 years:

Year	Rate	Year	Rate	Year	Rate	Year	Rate
1901.....	17.9	1908.....	14.9	1915.....	21.9	1922.....	21.2

## STILL-BIRTHS

There were 2,758 still-born children registered as births and 2,754 registered as deaths.

1926.....	2,812	2,802
1927.....	2,758	2,754

Table 4 is interesting in showing that of the 67,671 births which occurred in the Province, 10.2 were to mothers non-resident of the Province; 27.2 of the total number occurred in public institutions, presumably hospitals, and 72.8 elsewhere, presumably in the homes.

The average age of marriage during the year for males was 25.3 years and for females 24.7 years. The largest number of marriages occurred at 23 years for the men and 21 for the women.

Other tables relating to marriages will be found under Nos. 12 to 18 inclusive.

DEATHS

There were registered during the year 34,775 deaths. The rate per 1,000 of population was 10.9. There was a slight decrease of 1,134 and the rate was lower by 0.5. The same rate obtained in 1925 and is the second lowest rate in the decade.

### INFANT MORTALITY

The number of deaths of children under one registered in 1927 was 4,812, which gives a rate per 1,000 living births of 71.0 and is the lowest infant mortality rate that the Province has ever experienced. The next lowest was that of 1924 when the rate was 75.7.

It will be noted that there is a small rise in the typhoid rate almost equalling the rate of 1924, yet the rate of 1924 was the lowest that had ever been reached up to that time. In respect to measles the rate is the same as in 1925, and diphtheria shows a rise above both 1925 and 1926 but not so high as 1924. The rate for influenza is down considerably below that of 1926 but is a long way from the small figures it used to have prior to 1918. It was no common thing to find the rate for influenza below 10.0 while it has not been lower than 17.3 since the epidemic of 1918.

## TUBERCULOSIS

There were 1,803 deaths from tuberculosis, giving a rate of 56.5 per 100,000 population, this being the lowest rate ever reached. The following table shows the number of deaths for a decade in age groups:

It will be noted in the above table that the first peak to be reached in all years in the males is the 25-29 age group, while in the females it is the 20-24 age group. Beginning with the 5-9 year group there is a larger number of female deaths than of male deaths in each group and this obtains until the 40-44 year group is reached when the balance is the other way and obtains to the end of the seventh decade. The few deaths from tuberculosis in the 80 years and over group show the balance among the females.

## CANCER

As usual, the number of deaths from cancer for 1927 showed an increase over the number for 1926 or any preceding year. The rate, too, reached a higher peak of 99.6 per 100,000 population, being 0.6 higher than for the preceding year. The following table shows the distribution of deaths from the various types of cancer according to class:

The following table shows the death rates and per cent. from the various types of puerperal deaths. It will be noted that puerperal septicaemia is the

largest single cause in eight of the ten years shown. In 1921 and 1922 the rate from albuminuria exceeded the rate from septicaemia.
